Solution:

1. Challenges Faced	2. Missing measures of good public policy with each challenge
1. Local communities such as schools and hospitals were not properly consulted during the planning phase, leading to low ownership and poor understanding of project objectives.	1. The lack of community consultation shows a failure in community participation, which is essential for inclusive and accepted policymaking.
2. A uniform installation approach was applied across all districts without considering climatic and regional differences, causing inefficiency and technical problems.	2. Applying the same installation standards everywhere reflects a weakness in policy flexibility and local adaptation.
3. There was no systematic mechanism to collect feedback from end-users, resulting in unresolved operational and maintenance issues.	3. Absence of structured feedback mechanisms indicates a lack of feedback and evaluation measures in the policy process.
4. The initiative lacked innovation and local involvement, as it did not utilize locally assembled solar panels or train community technicians, increasing costs and reducing sustainability.	4. Ignoring local resources and skills highlights the absence of innovation and local capacity building, both key to long-term policy success.
